It or its fragments may be used in a specific and accurate method for detecting KRUV antibodies in the serum of hepatitis C patients. Antibodies directed against these polypeptides are useful for the purification of KCHV antigens and for the development of an improved diagnostic to detect KHCV antigens in a sample. The polypeptides may also be used in a vaccine for treatment and prevention of KHCV infection at a dosage of $-200 ug/peptide. (Updated on 27-AUG-2003 to correct OS
                                                                                                                                                                                                                                                                                                                                                                                                                                                             DNA and polypeptide(s) from a new type of hepatitis C virus (KHCV) - for diagnosing and vaccinating against KHCV infections.

The kit comprises antigenic proteins from both viruses. The HCV protein is pref. one of KHCV CORE 14, KHCV 897, KHCV NS4F, KHCV NS4E1E2 or KHCV NS5-1.2 proteins; the HBV protein is pref. HBV CORE or Pre S2 SAg protein. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 16-OCT -2003 to standardise OS field)

A library is constructed using a lambda gtil cloning system. This library is screened and cloned for antigenic activity. Clones isolated can be incorporated into a vector plasmid, which is then inserted into E.coli to give a transformant which expressed an antigenic protein having this amino acid sequence. The product may be used for the immunoassay of antibodies to NANBH antigen in samples of serum etc. for diagnostic purposes. See also

                                                                                                                                                                                                                                                                                                                                                    9
                                                                                                                                         This sequence is encoded by the genome of a blood transmissible non-A, non-B hepatitis (NANBH) virus. The cDNA sequence was isolated using the primers given in AAQ63500-35. The amplified fragments are used in the detection of hepatitis virus. The target DNA was isolated from serum of chronically infected NANBH patients who were C100 antibody-positive and HCV RNA (NSS region) positive. Reverse transcription-PCR and PCR were performed on cDNA and the total human NANBH DNA was constructed from 23

                                                                                                                                                                                                                                                                  evaluate the activity of hepatitis C virus (HCV). The system involves a chimeric DNA molecule with a non-cytopathic expression system, a HCV eccombinant DNA molecule encoding NS3-5 polyprotein linked to the expression system and a transactivator domain fused downstream of HCV DNA molecule and a second chimeric DNA molecule encoding a reporter gene surrogate cell-based system is useful for evaluating the activity of hepatitis C virus NS3 protease and is useful for identifying potential inhibitors of HCV NS3 protease activity. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a nucleic acid encoding a Met-NS3-NS4A-NS4B-NS5A-NS5B (NS stands for non-structural protein from HCV) polypeptide appearing as ABU09574. The encoded polypeptide has sufficient protease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Misc-difference 1711. 1713

activity to process itself to produce an NS5B protein that is carymatically inactive. Also included are a cultured recombinant cell comprising the novel nucleic acid, making an adenovector (comprising: comprising an adenovirus genome plasmid comprising a gene expression of cassette by homologous recombination between the novel nucleic acid and a nucleic acid comprising a first adenovirus region from base pair 1450 corresponding to either Ad5 or Ad6, a second adenovirus region from base pair 3511-5548 corresponding to Ad6, joined to the first region, a third adenovirus region from base pair 3549-28138 corresponding to Ad6, joined to the second region, a fourth adenovirus region from base pair 30818-33966 corresponding to Ad6, joined to the second region, a fourth adenovirus region from base pair 30818-33966 corresponding to Ad5 or from base pair 3089-33784 corresponding to Ad6, joined to the third region, and 40 rescond base pair 33967-35935 corresponding to Ad6, joined to the Court region, and 40 rescond from base pair 33967-35935 corresponding to Ad6 is in a fifth adenovirus region from base pair 33967-35935 corresponding to recombinant adenovirus plasmid), an adenovirus the from the tis produced by method above appearing as ACAG113 which has a humanised version of the polymore of the fivent and encodes the HCV inactivated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 polyprotein, a recombinant nucleic acid comprising one or more Ad6 regions and a region not present in Ad6, where at least one Ad6 region is selected from BlA, BlB, B2A, B4, L1, L2, L4 and L5. The nucleic acid is useful as a component of an adenoviral vector or a DNA plasmid vaccine providing a broad range of antigens for generating an HCV-specific cell mediated immune response. The nucleic acid may also be used in treating patients infected with HCV. The present sequence is the HCV polyprotein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 KATCTTHHDSPDADLIEANLLWRQEMGGNITRVESENKVVILDSFDPIRAVEDEREISVP

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ò
                                                                                                                               The invention relates to a nucleic acid encoding a Met-NS3-NS4A-NS5A (CC -NS5B (NS stands for non-structural protein from HCV) polypeptide appearing as AB109574. The encoded polypeptide has sufficient protease activity to process itself to produce an NS5B protein that is activity to process itself to produce an NS5B protein that is comprising the novel nucleic acid, making an adenovercen (comprising: (a) producing an adenovirus genome plasmid comprising a gene expression corresponding to either AG or AG, a second adenovirus region from base pair 1510 corresponding to AG, so income adenovirus region from base pair 3511-554 corresponding to AG, so accond adenovirus region from base pair 5542-2813 corresponding to AG, joined to the first region, a fourth adenovirus region from base pair 3514-554 corresponding to AG, joined to the second region, a fourth adenovirus region from base pair 3549-2813 corresponding to AG, joined to the second region, a fourth adenovirus region from base pair 3048-3396 corresponding to AG or from base pair 30789-33784 corresponding to AG, joined to the third region, and a fifth adenovirus region from base pair 3047-35935 corresponding to AG or from base pair 30789-33784 corresponding to AG, joined to the third region, base pair 30789-33784 corresponding to AG, joined to the third region, base pair 30789-33784 corresponding to AG, joined to the third region, base pair 30789-33784 corresponding to AG, joined to the third region, base pair 30789-33784 corresponding to AG, joined to the fourth region, and (b) rescuing the recombinant adenovirus plasmid), an adenovirus from the fourth region are appearing as AGA61113 which has a humanised version of the polyprotein, a recombinant mucleic acid comprising one or more AG polymucleotide of the invention and encodes the HCV inactivated providing a broad range of antigens for generating and AGA61113 which has a humanised version of the present sequence is the wild-type HCV patings infected with HCV. The present sequence is the wild-type HCV by and 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1187 KATCTTHHVSPDADLIEANLLWRQEMGGNITRVESENKVVVLDSFDPLRAEEDEREVSVP 1246

This invention relates to a novel method for producing a Hepatitis C virus (HCV) replicon having an increased replication activity.

Specifically, it refers to modifying an HCV replicon construct to encode an amino acid substitution in NS3 (a non-structural protein that along with NS4A, NS4B, NS5A and NS5B make up the virus replication machinery released in the form of a polyprotein). The present invention describes an amino acid substitution at a position corresponding to amino acid 232 of NS5A that confers improved cell culture replication activity compared to wild type HCV. The method is useful for facilitating the identification of broadly efficacious compounds against different HCV isolates and facilitating HCV research, where compounds that inhibit HCV replication have research and therapeutic applications in identifying overall efficacy and lack of the onset of HCV in a patient. This polypeptide sequence is the HCV NS3 HTD NSSB polyprotein based on HCV-BK with a 471M mutation (corresponds to a feature).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1187 KATCTTHHVSPDADLIEANLLWRQEMGGNITRVESENKVVVLDSFDPLRAEEDEREVSVV 1246

A novel method for reproducing in vitro the RNA-dependent RNA polymerase (RdRp) activity or the terminal nucleotidyl transferase (TNTase) activity cor encoded by hepatisis of virus (HCV), is characterised in that sequences contg. NS5B are used in the mixture. The method is used for assaying in vitro the activities of RdRp and TNTase encoded by HCV in order to contg. NS5B are used in the mixture. The method is used for assaying in certain the replaces, compounds that inhibit these enzymatic activities and therefore might interfere with the replication of the HCV. The present sequence comprises amino acids 810-3010 of the CV polyprotein and corresponds to NS2-NS5B proteins. CDNA encoding this protein was cloned between the NCOI and HindIII sites of pBlueBacIII to form pBac25. Another expression plasmid, pBac5B (containing cDNA encoding canno acids 2420-3010 of HCV; see AAWOIFO3) was also constructed.

Extracts of Bac25- or Bac5B-infected Sf9 cells contain a novel magnesium-dependent enzymatic activity that catalyses de novo RNA synthesis. This cativity was shown to be dependent on the presence of RNA, but independent of an added primer or of the origin of the input RNA condecule. As the products generated by extracts of Sf9 cells infected with either Bac35 or Bac5B-infected by extracts of Sf9 cells infected with either Bac35 or Bac5B-infected by extracts of Sf9 cells infected with either Bac35 or Bac5B-infected by extracts of Sf9 cells infected with either Bac35 or Bac5B-infected by extracts of Sf9 cells infected with either Bac35 or Bac5B-infected by extracts of Sf9 cells infected broadcated that the observed RdRp activity is encoded by the HCV NS5B corrector. (Updated on 25-MAR-2003 to correct PR field.) (Updated on 17-OCT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Reproducing enzymatic activities of HCV in vitro - using sequences contg. NS5B for RNA-dependent RNA polymerase and terminal nucleotidyl
                                                                                                                                                                                                                                                                            Hepatitis C virus, HCV, non-structural protein, NS5B, polyprotein, RNA-dependent RNA polymerase, RdRp, terminal nucleotidyl transferase, TNTase, method, assay, in vitro activity, therapy, inhibitor.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

genome polyprotein - hepatitis C virus
N;Contains: capsid protein C; envelope protein M; hepacivirin (EC 3.4.21.98) (nonstruct)
protein NS4s; nonstructural protein NS4b; nonstructural protein NS5
(5,Species: hepatitis C virus
C;Date: 19-May-2000 #sequence_revision 19-May-2000 #text_change 09-Jul-2004
C;Accession: $40770; PC1285
B;Okamoto, H.

genome polyprotein - hepatitis C virus (isolate EUH1480)
N;Contains: capsid protein C; envelope protein M; hepacivirin (EC 3.4.21.98) (nonstructu protein NS43; nonstructural protein NS45; nonstructural protein NS5
                                                                                                                                                                                          Cyspecies hepatitis C virus
C;Species hepatitis C virus
C;Date: 19-May-2000 #sequence_revision 19-May-2000 #text_change 09-Jul-2004
C;Accession: JCS620
